Task Sprint Backlog

an artifact of the Sprint Planning Meeting

- Scrum Team has selected and committed to deliver a set of top priority features from the Product Backlog, the Product Backlog's features are broken down into a Sprint Backlog
- a list of the specific development tasks required to implement a feature
- These tasks are broken down into pieces that will require less than two days (or sixteen developer-hours) of work. When the Sprint Backlog is complete, the total work estimated is compared with original estimates from the Product Backlog. If there is a significant difference, the team negotiates with the Product Owner to get the right amount of work to take into the Sprint with a high probability of success.

The screenshot shows a presentation slide titled "Planning Poker for Estimation" with the Hexaware logo in the top right corner. The slide lists six steps for the process. A yellow sticky note with the text "Fibonacci Series 1, 2, 3, 5, 8, 13, ..." is placed over the bottom right of the slide. The presentation is being viewed in a web browser window with a Windows taskbar at the bottom.

Planning Poker for Estimation

- First, create a common understanding of User Story (no technical details)
- Choose a reference
- Estimate size in relation to reference - but don't tell anyone yet
- Show your cards at the same time
- Discuss differences
- Repeat estimation until consensus
- Estimated User Story becomes new reference

Fibonacci Series
1, 2, 3, 5, 8, 13, ...

How Do We Know If We Can Commit

For each story in an iteration the team will:

- Ask any clarifying questions
- Break the work to complete the story into tasks using a very simple scale
 - 0.5, 1, 1.5 or 2 days are the allowable task durations
- The task list must be everything required to make the story be "Done"
- For each story a number representing task days per size point is calculated
Eg. If a story is a size 3 and the task estimates add to 4 days, the number calculated would be 4/3 or 1.33
- After all stories have the number calculated, any story with a number that is not near the average is re-examined
 - Does the story need to be re-sized?(do it!)
 - Did we forget some tasks?(add them)
 - Is it just rounding error and it is ok?

Scalability & Scrum of Scrums

Typical individual team is 7 ± 2 people

- Scalability comes from teams of teams

Factors in scaling

- Type of application
- Team size
- Team dispersion
- Project duration

Scrum has been used on multiple 500+ person projects also
